KRIYOPAY / TRANSPORT OPERATIONS

One control center for every trip

Fleet visibility, dispatch, delivery progress, and trip economics in one connected workspace.

PRODUCT OVERVIEW · CLIENT DEMONSTRATION

THE OPERATING CHALLENGE

Transport work spans too many handoffs

KriyoPay gives operations, finance, drivers, and customers a shared view of the same job.

01 / BEFORE DISPATCH

Before dispatch

Orders, customer details, vehicle availability, and driver schedules live in separate workflows.

02 / DURING THE TRIP

During the trip

Teams need location, status, exception, and delivery updates while the truck is moving.

03 / AFTER DELIVERY

After delivery

Costs, proof of delivery, customer billing, driver settlement, and margin need to reconcile.

KriyoPay connects the trip lifecycle

From customer order and assignment through delivery, cost capture, settlement, and review.

PRODUCT MAP

A connected workflow for transport operations

Each module contributes to the same operational record, with role-based access for the team.

01

Plan

Orders, customers, branches

02

Assign

Drivers, vehicles, schedule

03

Move

Location, stops, alerts

04

Deliver

Status, proof, documents

05

Settle

Revenue, expenses, margin

SHARED FOUNDATION

Company and branch context

Users and roles

Audit trail

Documents and exceptions

One workspace keeps operating records connected

The demo uses a single Bengaluru Operations branch and synthetic accounts, routes, and transactions.

LIVE OPERATIONS

Fleet control center

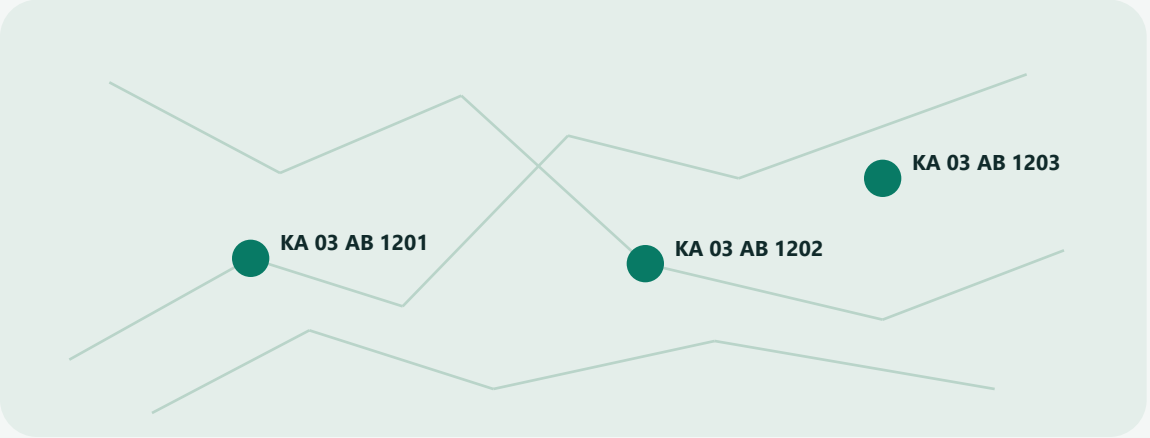

A concise view of active work, fleet capacity, current locations, and the operator queue.

8	8	3	1
Active trucks	Active drivers	Trips underway	Awaiting review

LIVE OPERATIONS

3 reporting locations

The demo map shows sample positions linked to active trips.
Operators can open a vehicle or trip for context.

Work queue

Trip review · Follow-ups · Driver settlements

Location freshness depends on the selected phone or GPS provider and its reporting interval.

VEHICLE VISIBILITY

Location and trip context

Bring vehicle position together with the delivery job and the next operational action.

Live position

See reporting vehicles and their associated active trip.

Trip history

Review recorded location points and progress over a trip.

Geofences

Define arrival areas for factories, depots, and customer sites.

Exceptions

Surface route, stop, idle, and timing events for follow-up.

Integration boundary The demo contains synthetic reporting locations. Continuous tracking, traffic-aware ETA, and device events require a configured provider and suitable vehicle hardware or driver phone permissions.

DISPATCH

From open order to assigned trip

Dispatchers can review the work, choose available resources, and follow each trip through its status changes.

STEP 01

Open orders

Customer, pickup, destination, load

STEP 02

Resource match

Driver, truck, availability, capacity

STEP 03

Trip plan

Stops, delivery window, route, return load

STEP 04

Dispatch

Assign, communicate, monitor

Demo dataset

14 transport orders / 10 trips / sample drivers and vehicles

Availability and route recommendations depend on accurate operating data and configured map services.

TRIP EXECUTION

Keep delivery progress visible

A shared trip record gives dispatch and customer-facing teams a consistent status to work from.

- **Trip status**

  Follow planned, active, completed, and review states.

- **Stops and events**

  Record pickup, arrival, departure, and delivery updates.

- **Proof of delivery**

  Attach delivery photos, signature, and proof to the shipment record.

- **Customer updates**

  Share a tracking link and relevant status notifications.

TRIP ECONOMICS

Understand the cost and margin of a trip

Capture trip revenue and operating costs to make review more specific than a vehicle-level total.

Revenue

Freight and trip income

Record planned and actual amounts with the trip so supervisors can spot budget overruns and investigate unusual spend.

Costs

Fuel, tolls, and other spend

Enter fuel fills, tolls, maintenance, and driver expenses. Vehicle mileage and fuel benchmarks support efficiency review.

Outcome

Margin for review

Compare trip income with recorded costs after approval. The control center highlights approved trip margin and review queues.

DEMO EXAMPLES

Fuel and toll budget alerts

4 transport invoices

Driver settlement balance

Synthetic values illustrate the workflow, not customer performance or forecasts.

FLEET & DRIVER MANAGEMENT

Keep assets and people ready for work

Maintain the records dispatch needs and make service obligations easier to see.

Vehicles

Registration, type, capacity, efficiency benchmark, availability.

Drivers

Contact, staff reference, linked account, assigned trips.

Maintenance

Service, tyre, and repair history, upcoming work, breakdown records.

Documents

Insurance, PUC, fitness, licence, and expiry tracking where configured.

Demo fleet

8 vehicles / 8 drivers / maintenance and service examples

Automated reminders depend on accurate odometer, date, and document records.

FINANCE & RECORDS

Connect transport activity to finance

Transport records sit alongside the wider KriyoPay invoice, vendor, and procurement workflows.

Customer billing

- Customer freight rates
- Trip invoice records
- Outstanding collections

Driver and vendor

- Advances and settlements
- Vendor and transporter payments
- Driver expense records

Business controls

- Approvals and exceptions
- Branch and audit context
- Trip-level profitability review

Demonstration records

20 purchase invoices / 4 customer transport invoices / sample collections and driver salary settlement

INDIA OPERATIONS

Adapt workflows to local transport needs

Use the core trip record as the base, then connect the authorized services each operation depends on.

FASTag	Toll expense capture	**E-Way Bill**	Shipment compliance records
LR / GR	Consignment documentation	**Challan**	Penalty and vehicle records
UPI	Driver settlement flow	**WhatsApp**	Customer and driver messages
Languages	Hindi, Marathi, and regional usability	**Branches**	Separate transport offices and teams

Integration note FASTag, E-Way Bill, UPI, and messaging require suitable authorized providers, credentials, and customer configuration. Availability varies by provider.

AI & AUTOMATION

AI opportunities for the next phase

Use operational data to reduce manual review and help teams ask better questions. These are roadmap capabilities, not claims about the current demo.

Fleet assistant	Ask about trip margin, fuel outliers, and delivery delays using company records.
Predictive maintenance	Use mileage, repair history, and service intervals to flag likely upcoming work.
Route recommendations	Compare distance, tolls, deadlines, traffic, and vehicle constraints.
Document extraction	Read LR, invoice, and fuel receipt details for operator confirmation.
Business insights	Highlight unprofitable routes, underused vehicles, expense trends, and late payments.

AI outputs should support operator decisions and remain reviewable against source records.

IMPLEMENTATION BOUNDARIES

Connect capabilities in a practical sequence

Start with a reliable operating record, then add data sources and automation where they create measurable value.

Core setup	Company, branches, roles, vehicles, drivers, customers, rates
Operational adoption	Orders, assignment, trip status, expenses, delivery evidence
Connected data	Phone and GPS providers, map services, messaging, FASTag or compliance APIs
Optimization	AI assistant, prediction, document extraction, route recommendations

Potential later modules Warehouse operations / load marketplace / expanded finance management

LIVE DEMONSTRATION

A five-minute client walkthrough

Use the synthetic KriyoPay Demo Logistics workspace to show one connected transport story.

1 **Overview**

Start with the fleet snapshot, live locations, work queue, and alerts.

2 **Dispatch**

Open an order and show vehicle, driver, and trip assignment.

3 **Tracking**

Select a reporting vehicle and explain the active trip context.

4 **Trip costs**

Review income, expenses, budget alerts, and approval state.

5 **Delivery**

Open the sample customer shipment link and show its status.

6 **Close**

Explain provider setup, customer-specific configuration, and roadmap choices.

Demo safety All names, trips, vehicle locations, and financial values shown in the demo are synthetic.

A clearer operating picture for every trip

The client discussion can now focus on fleet mix, dispatch rules, tracking sources, customer updates, and the financial records that matter most.

DISCOVERY QUESTIONS

- Which fleets, branches, and roles should the pilot include?
- Will vehicles report from driver phones, GPS devices, or both?
- Which proof-of-delivery, billing, and local integrations are required?
